

DON'T GET PHISHED

tips and tricks to avoid taking the bait

PREPARATION & DEFENSES

- 1 Recognize the signs of a phisher.**
Poor grammar, shady email address domains, and (for those who normally have signatures) no email signature all indicate you have received a phishing email.
- 2 Think twice before logging in again.**
Phishing emails can be forwarded from colleagues without their knowledge. If they linked you to a page that requires you to log in, double-check the URL.
- 3 Utilize Advanced Threat Protection (ATP).**
With ATP, your Outlook/Exchange Online gains antivirus engines, email attachment scanning, hyperlink protections, and security analytics.

THREAT MITIGATION & COMPLIANCE

- 1 Lock your doors.**
Ensure fundamental security configurations are in place. These configurations include firewalls, antiviruses, and security settings in your business applications.
- 2 Protect your hybrid-cloud environment.**
For information on-prem and in the cloud, implement and monitor security for linked machines and VMs.
- 3 Stay updated with compliance requirements.**
Utilize a service or devote your own time to assessment and remediation. The TechHouse Security Toolkit builds a custom roadmap to compliance for you.
